Bioremediation Ronald L. Crawford 2005-09-08 Industrial and agricultural activity throughout this century has led to considerable contamination of soil and groundwater resources by hazardous chemicals. The technique of bioremediation uses living organisms--usually bacteria and fungi--to remove pollutants from soil and water with minimal disturbance to these environments. This approach, which is potentially more cost-effective than traditional techniques such as incineration of soils and carbon filtration of water, requires an understanding of how organisms transform chemicals, how they survive in polluted environments, and how they can be used in the field. This book examines these issues for many of the most serious and common environmental contaminants, presenting the most recent position on the application of bioremediation to polluted soil and water.

Applying Cognitive Science to Education Frederick Reif 2008 An accessible introduction to some of the cognitive issues important for thinking and learning in scientific or other complex domains (such as mathematics, physics, chemistry, engineering, or expository writing), with practical educational applications and implementation methods. Many students find it difficult to learn the kind of knowledge and thinking required by college or high school courses in mathematics, science, or other complex domains. Thus they often emerge with significant misconceptions, fragmented knowledge, and inadequate problem-solving skills. Most instructors or textbook authors approach their teaching efforts with a good knowledge of their field of expertise but little awareness of the underlying thought processes and kinds of knowledge required for learning in scientific domains. In this book, Frederick Reif presents an accessible coherent introduction to some of the cognitive issues important for thinking and learning in scientific or other complex domains (such as mathematics, science, physics, chemistry, biology, engineering, or expository writing). Reif, whose experience teaching physics at the University of California led him to explore the relevance of cognitive science to education, examines with some care the kinds of knowledge and thought processes needed for good performance; discusses the difficulties faced by students trying to deal with unfamiliar scientific domains; describes some explicit teaching methods that can help students learn the requisite knowledge and thinking skills; and indicates how such methods can be implemented by instructors or textbook authors. Writing from a practically applied rather than predominantly theoretical perspective, Reif shows how findings from recent research in cognitive science can be applied to education. He discusses cognitive issues related to the kind of knowledge and thinking skills that are needed for science or mathematics courses in high school or colleges and that are essential prerequisites for more advanced intellectual performance. In particular, he argues that a better understanding of the underlying cognitive mechanisms should help to achieve a more scientific approach to science education.

From The Preface The following notes are by no means intended as a rule of thought by which nurses can teach themselves to nurse, still less as a manual to teach nurses to nurse. They are meant simply to give hints for thought to women who have personal charge of the health of others. Every woman, or at least almost every woman in England, has, at one time or another of her life, charge of the personal health of somebody, whether child or invalid - in other words, every woman is a nurse. Every day sanitary knowledge, or the knowledge of nursing - or in other words, of how to put the constitution in such a state as that it will have no disease, or that it can recover from disease, takes a higher place. It is recognized as the knowledge which every one ought to have - distinct from medical knowledge, which only a profession can have. If, then, every woman must at some time or other of her life, become a nurse, i.e., have charge of somebody's health, how immense and how valuable would be the produce of her united experience if every woman would think how to nurse. I do not pretend to teach her how, I ask her to teach herself, and for this purpose I venture to give her some hints.

The Art Salon in the Arab Region Monique Bellan 2019-03 This volume discusses the emergence and role of the art salon in the Arab region in the nineteenth and twentieth centuries, focusing on Algeria, Tunisia, Egypt, Lebanon and Iraq. Institutional forms of exhibiting and teaching art emerged in the Middle East and North Africa in late colonial and early post-colonial contexts. The book examines how the salon had an impact on the formation of taste and on debates on art, and discusses the transfers and cultural interactions between the Middle East, North Africa and Europe. Following the institutional model of the Paris salons, art salons emerged in Algiers, Tunis and Cairo starting in the late 1880s. In Beirut, the salon tradition reached its peak only after independence in the mid-twentieth century. Baghdad never had a formal salon, but alternative spaces and exhibition formats developed in Iraq from the late 1940s onwards. As in Paris, the salons in the region often defined the criteria of artistic production and public taste. The impact of the salon also lay in its ability to convey particular values, attitudes and aspirations. At the same time, the values and attitudes promoted by the salon as well as the salon itself were often subject to debate, which led to the creation of counter-salons or alternative exhibition practices. The art salon helps us to understand changes in the art systems of these countries, including the development of art schools, exhibition spaces and artist societies, and gives insight into the power dynamics at play. It also highlights networks and circulations between the Arab region and Europe.
